

From old to new

Our technicians are constantly working on the development of cableway systems and improvements of single components. In addition to the technical innovations in revisions and conversions of older plants, design changes can also be implemented. Passengers and plant operators wish a sophisticated design and a comfortable driving experience.

Besides the stations, there are a lot of rebuilding options and improvements in the comfort of the vehicles: seat cushions, hood controls with Bowden cable, comfort upholstery, colored hoods, installation of a height adjustable conveyor belt, single foot raster to increase safety. Of course, your old cabin can be exchanged for a new one, in different variants and colors. As can be seen in the following pictures, an older plant can be modified for a completely new appearance:

RENEWAL OF INSTALLATION CD6C PLATEAU – KRONPLATZ/IT

RENEWAL OF VEHICLES CD4C VORDERER SCHÖNTAUF-SULDEN/IT

RENEWAL OF VEHICLES CD4C HAUNOLD - INNICHEN/IT

In order to implement these conversions in a timely manner, a good planning is necessary. If you are thinking of a conversion next spring, we ask you to contact your customer service representative at the beginning of the winter season.

For further information please do not hesitate to contact your customer support.

Caution for installations with restricted downhill transportation!

It is essential to comply with the restricted capacity when descending - otherwise the rope can be lifted from the compression roller battery or the support roller battery will be overloaded. In addition, the brakes are set for reduced capacity only. The safety of the passengers is jeopardized if the permissible downhill transportation is exceeded.

In order to provide information on the permissible load on the downhill transportation, we offer a signboard, which can be installed in the station.

Please contact your account manager.
